We are now proposing to bring the omics revolution to the brain, the most complex organ with the largest number of cell types. With leaders spanning genomics, proteomics, basic and clinical neuroscience, and computer science, we will create a suite of new tools and analysis methods that allow neuroscientists to interrogate what genes and proteins are produced in their favorite neuronal types, and what other neuronal types their favorite neurons connect with.

A research team from The Walter and Eliza Hall Institute has adopted a single-cell, multi-omics approach to explore this question, focusing particularly on T and B lymphocyte formation. They discovered a new stage in lymphocyte development, information which the researchers say could "enrich future studies of the immune system". We
